SUBMITTED OR TRANSMITTED IN
COMPLIANCE WITH RULE 17.1(a) OR (b)

The Patent Office
Concept House
Cardiff Road
Newport
South Wales
NP10 8QQ

I, the undersigned, being an officer duly authorised in accordance with Section 74(1) and (4) of the Deregulation & Contracting Out Act 1994, to sign and issue certificates on behalf of the Comptroller-General, hereby certify that annexed hereto is a true copy of the documents as originally filed in connection with the patent application identified therein.

In accordance with the Patents (Companies Re-registration) Rules 1982, if a company named in this certificate and any accompanying documents has re-registered under the Companies Act 1980 with the same name as that with which it was registered immediately before re-registration save for the substitution as, or inclusion as, the last part of the name of the words "public limited company" or their equivalents in Welsh, references to the name of the company in this certificate and any accompanying documents shall be treated as references to the name with which it is so re-registered.

In accordance with the rules, the words "public limited company" may be replaced by p.l.c., plc, P.L.C. or PLC.

Re-registration under the Companies Act does not constitute a new legal entity but merely subjects the company to certain additional company law rules.

Warning

After an application for a patent has been filed, the Comptroller of the Patent Office will consider whether publication or communication of the invention should be prohibited or restricted under Section 22 of the Patents Act 1977. You will be informed if it is necessary to prohibit or restrict your invention in this way. Furthermore, if you live in the United Kingdom, Section 23 of the Patents Act 1977 stops you from applying for a patent abroad without first getting written permission from the Patent Office unless an application has been filed at least 6 weeks beforehand in the United Kingdom for a patent for the same invention and either no direction prohibiting publication or communication has been given, or any such direction has been revoked.

Notes

- If you need help to fill in this form or you have any questions, please contact the Patent Office on 0645 500505.
- Write your answers in capital letters using black ink or you may type them.
- If there is not enough space for all the relevant details on any part of this form, please continue on a separate sheet of paper and write "see continuation sheet" in the relevant part(s). Any continuation sheet should be attached to this form.
- If you have answered 'Yes' Patents Form 7/77 will need to be filed.
- Once you have filled in the form you must remember to sign and date it.
- For details of the fee and ways to pay please contact the Patent Office.

FABRIC CARE COMPOSITION

Technical Field

5

This invention relates to fabric care compositions, including detergent compositions and laundry rinse compositions. The invention also relates to methods of treating fabric using the compositions of the invention and to the use of anionic polymers in fabric care compositions.

10

Background and Prior Art

15

The laundry process generally has several benefits for fabric, the most common being to remove dirt and stains from the fabric during the wash cycle and to soften the fabric during the rinse cycle. However, there are numerous disadvantages associated with repeated use of conventional laundry treatment compositions and/or the actual laundry process; one of these being a fairly harsh treatment of fabric in the laundry process.

20

Fabrics can be damaged in several ways as a result of repeated laundering and/or wear. Fabric pilling and loss of fabric surface appearance eg fuzzing, shrinkage (or expansion), loss of colour from the fabric or running of colour on the fabric (usually termed dye transfer) are some of the common problems associated with repeated laundering. These

25

problems may occur merely from repeated hand washing as well as the more vigorous machine washing process. Furthermore, problems relating to damage of fabric over time through normal use, such as loss of shape and increased likelihood of wrinkling are also significant.

Laundry detergent compositions containing polyamide-polyamine fabric treatment agents are described in WO 98/29530. The compositions are claimed to impart improved overall appearance to fabrics laundered using the detergent compositions, in terms of surface appearance properties such as pill/fuzz reduction and antifading. Laundry compositions containing polyamide-polyamine treatment agents of similar types are taught in WO 97/42287.

WO 96/15309 and WO 96/15310 describe anti-wrinkle compositions which contain a silicone and a film-forming polymer. A wide range of possibilities is given for the film-forming polymer.

An industrial process for treating fibres is disclosed in US 3949014. This document describes the use of a polyamine-epichlorohydrin resin in a binder, together with an amphoteric high molecular weight compound having at least 2 cationic groups and at least 2 anionic groups per molecule. US 3949014 mentions the treatment of fabrics with the binder but it is clear that the treatment is intended to be carried out industrially as part of a fabric treatment process rather than as part of a domestic laundering process and this conclusion is supported by the fact that the fabric treated with the binder required curing at a relatively high temperature. Industrial curing of fabrics treated with this type of polymer is normally carried out at about 150°C.

Methods for treating wool with compositions containing an amino functional polymer and a silicone polymer so as to impart shrink resistance are known. However, as described in EP-A-0315477, wool requires a pretreatment before such compositions can be used. Furthermore, EP-A-0372782 explains that the chemistry of wool is quite different from that of

cellulosic fibres such as cotton and the requirements for shrink resistance treatments for cotton are generally very different from those for wool.

5 US 4371517 discloses compositions for treating fibrous materials which contain cationic and anionic polymers. In a non-domestic treatment, the compositions increased the rigidity of cotton fabric.

10 Detergent compositions which prevent dye transfer are taught in EP-A-0068232. The compositions contain nonionic or zwitterionic surfactants in combination with water-soluble, amino and/or amide group-containing polymers.

WO 98/17764 discloses the use of polyamidoamines, in washing and cleaning compositions, as soil release agents.

15

Co-emulsifiers, for use in fabric softener and other compositions, which contain cationic quaternary amine polymers, are taught in DD 221922.

20 The present invention involves compositions containing cationic polymers, such as amine- or amide-epichlorohydrin resins, having the advantages of improved dye transfer properties ie, a reduced tendency for dye transfer to take place when fabrics have been treated with the compositions. As mentioned above, dye transfer involves the release of dye from one part of a coloured fabric and its redeposition at another part of the fabric and is
25 usually undesirable where a fabric has regions which are differently coloured.

The present invention also has advantages in terms of stain release. Stain release is a measure of the ability of a composition to remove stains (ie, relatively highly soiled areas) from a fabric during a laundering process.

5 Definition of the Invention

According to the present invention, there is provided a fabric care composition adapted for use in a laundering process comprising at least one cationic polymer which is an amine- or amide-epichlorohydrin resin or
10 derivative thereof, at least one anionic polymer and at least one textile compatible carrier, wherein the cationic polymer and the anionic polymer are present in amounts such that the overall charge provided by the polymers is positive.

15 A further aspect of the present invention relates to the use of an anionic polymer to improve the dye transfer properties of a fabric care composition which comprises a cationic polymer.

In yet another aspect, the present invention provides the use of an anionic
20 polymer to improve the stain release properties of a fabric care composition which comprises a cationic polymer.

Also provided by the present invention is a method of treating fabric comprising applying to the fabric a fabric care composition according to
25 the invention as part of a laundering process.

Detailed Description of the Invention

The fabric care compositions of the invention comprise, as one component, at least one amine- or amide-epichlorohydrin resin or derivative thereof.

In the context of the present invention these first materials are polymeric, or at least oligomeric, in nature. Preferably, they have a weight average mean molecular weight of from 300 to 1,000,000 daltons.

The resins of the invention are sometimes referred to below as amine-epichlorohydrin resins and polyamine-epichlorohydrin (PAE) resins (the two terms being used synonymously) although these terms encompass both the amine and amide resins of the invention and their derivatives. The resins may also have a mixture of amine and amide groups.

The amine- or amide-epichlorohydrin resins may have one or more functional groups capable of forming azetidinium groups and/or one or more azetidinium functional groups.

Alternatively, or additionally, the resins may have one or more functional groups that contain epoxide groups or derivatives thereof eg Kymene™ 450 (ex Hercules).

Suitable polyamine-epichlorohydrin (PAE) resins include those described in "Wet Strength Resins and Their Application", pp 16-36, ed. LL Chan, Tappi Press, Atlanta, 1994. Suitable resins can be identified by selecting those resins which impart increased wet strength to paper, after treatment,
5 in a relatively simple test.

Any amine- or amide-epichlorohydrin resin having an epoxide functional group or derivative thereof is suitable for use according to the invention.

10 A particularly preferred class of amine- or amide-epichlorohydrin resins for use in the invention are secondary amine- or amide-based azetidinium resins, for example those resins derived from a polyalkylene polyamine eg diethylenetriamine (DETA), a polycarboxylic acid eg adipic acid or other dicarboxylic acids, and epichlorohydrin. Other polyamines or polyamides
15 can also be advantageously used in the preparation of suitable PAE resins.

Another preferred class of amine-epichlorohydrin resins for use in the invention are those having an epoxide functional group or derivative thereof eg a chlorohydrin group.

20

The resin is preferably present in the product in a sufficient quantity to give an amount of 0.0005-5% by weight on the fabric based on the weight of fabric (owf), more preferably 0.001-2% owf. The amount of the resin in the composition required to achieve the above % by weight on fabric
25 will typically be in the range 0.01% to 35% by weight, preferably 0.1% to 13.5% by weight.

The resin may be a PDAA-epichlorohydrin resin or a PMDAA-epichlorohydrin resin. PDAA is poly(diallylamine) and PMDAA is poly(methyldiallyl (amine)).

- 5 The fabric care compositions of the invention also comprise at least one anionic polymer.

The anionic polymer is present in the composition in an amount such that the overall negative charge contributed by the anionic groups of the
10 anionic polymer is less than the positive charge provided by the cationic groups of the cationic polymer (such as the amine-epichlorohydrin resin) and any cationic groups in the anionic polymer. Suitable amounts of anionic polymer in the composition are in the range of from 0.01% to 35% by weight, preferably 0.1% to 13.5% by weight. If the overall
15 charge provided by the anionic polymer and the cationic polymer, as described above, is not positive, the cationic polymer tends not to impart the benefits to the fabric which are imparted to the fabric in the absence of the anionic polymer.

- 20 The anionic polymer may be any polymeric compound having a single unit which repeats in the compound, on average at least five times, a plurality of anionic groups and a molecular weight of at least 400 Da, preferably at least 600 Da. The anionic polymer has negatively charged groups which may be present in the repeating group and/or at one or both of the ends of
25 the polymer chain and may be introduced during polymerisation or after the polymer has been formed. The anionic polymer may contain cationic groups as well as anionic groups but the net charge on the polymer chain must be negative. The anionic polymer can be wholly or partly amphoteric, provided that it is capable of having a net negative charge in

the presence of the cationic polymer. It is preferred that the anionic polymer comprises anionic groups which are oxoanions of sulphur, carbon or phosphorus, or derivatives thereof such as, for example sulphonate (SO_3^-) and carboxylate (CO_2^-) groups. Preferably, the anionic polymer is
5 a polyacrylate/styrene block copolymer.

The compositions of the invention, when applied to a fabric, may be cured by a domestic curing step including ironing and/or domestic tumble drying, preferably tumble drying. Preferably, these curing steps are
10 carried out at temperatures in the range of from 60 to 100°C, more preferably from 80 to 100°C.

The compositions of the invention may be used before, during or after a conventional laundry process and are preferably packaged and labelled as
15 such. The laundry process includes large and small scale processes, and is preferably a domestic process.

When the compositions of the invention are to be used before or after the laundry process, they may be in the form of a spray or foaming product.
20

When the compositions of the invention are to be used during the laundry process, they may be used at any convenient stage of the process, such as, for example, in a pre-wash composition, in the main wash detergent composition and/or a rinse composition.
25

In the context of the present invention the term 'textile compatible carrier' means a component which can assist in the interaction of the first component (ie, the PAE resin) with the fabric. The carrier can also provide benefits in addition to those provided by the first component eg

softening, cleaning etc. The nature of the carrier will depend upon at what stage of the laundry process the composition of the invention is used. The carrier may be water or a detergent-active compound or a fabric softener or conditioning compound or other suitable detergent or fabric treatment agent.

If the composition of the invention is to be used in a laundry process as part of a conventional fabric treatment product, such as a detergent composition, the textile-compatible carrier will typically be a detergent-active compound. Whereas, if the fabric treatment product is a rinse conditioner, the textile-compatible carrier will be a fabric softening and/or conditioning compound.

Detergent Active Compounds

If the composition of the present invention is in the form of a detergent composition (such as a main wash composition), the textile-compatible carrier may be chosen from soap and non-soap anionic, cationic, nonionic, amphoteric and zwitterionic detergent active compounds, and mixtures thereof.

Many suitable detergent active compounds are available and are fully described in the literature, for example, in "Surface-Active Agents and Detergents", Volumes I and II, by Schwartz, Perry and Berch.

The preferred textile-compatible carriers that can be used are soaps and synthetic non-soap anionic and nonionic compounds.

Anionic surfactants are well-known to those skilled in the art. Examples include alkylbenzene sulphonates, particularly linear alkylbenzene sulphonates having an alkyl chain length of C_8-C_{15} ; primary and secondary alkyl sulphates, particularly C_8-C_{15} primary alkyl sulphates; alkyl ether
5 sulphates; olefin sulphonates; alkyl xylene sulphonates; dialkyl sulposuccinates; and fatty acid ester sulphonates. Sodium salts are generally preferred.

Nonionic surfactants that may be used include the primary and secondary
10 alcohol ethoxylates, especially the C_8-C_{20} aliphatic alcohols ethoxylated with an average of from 1 to 20 moles of ethylene oxide per mole of alcohol, and more especially the $C_{10}-C_{15}$ primary and secondary aliphatic alcohols ethoxylated with an average of from 1 to 10 moles of ethylene oxide per mole of alcohol. Non-ethoxylated nonionic surfactants include
15 alkylpolyglycosides, glycerol monoethers, and polyhydroxyamides (glucamide).

Cationic surfactants that may be used include quaternary ammonium salts of the general formula $R_1R_2R_3R_4N^+ X^-$ wherein the R groups are
20 independently hydrocarbyl chains of C_1-C_{22} length, typically alkyl, hydroxyalkyl or ethoxylated alkyl groups, and X is a solubilising anion (for example, compounds in which R_1 is a C_8-C_{22} alkyl group, preferably a C_8-C_{10} or $C_{12}-C_{14}$ alkyl group, R_2 is a methyl group, and R_3 and R_4 , which may be the same or different, are methyl or hydroxyethyl groups);
25 and cationic esters (for example, choline esters) and pyridinium salts.

The total quantity of detergent surfactant in the composition is suitably from 0.1 to 60 wt%, eg 0.5-55 wt%, such as 5-50 wt%.

Preferably, the quantity of anionic surfactant (when present) is in the range of from 1 to 50% by weight of the total composition. More preferably, the quantity of anionic surfactant is in the range of from 3 to 55% by weight, eg 5 to 30% by weight.

5

Preferably, the quantity of anionic surfactant is in the range of from 3 to 35% by weight, eg 5 to 30% by weight.

10 Preferably, the quantity of nonionic surfactant when present is in the range of from 2 to 25% by weight, more preferably from 5 to 20% by weight.

Amphoteric surfactants may also be used, for example amine oxides or betaines.

15 The compositions may suitably contain from 10 to 70%, preferably from 15 to 70% by weight, of detergency builder. Preferably, the quantity of builder is in the range of from 15 to 50% by weight.

20 The detergent composition may contain as builder a crystalline aluminosilicate, preferably an alkali metal aluminosilicate, more preferably a sodium aluminosilicate.

The aluminosilicate may generally be incorporated in amounts of from 10 to 70% by weight (anhydrous basis), preferably from 25 to 50%.

25 Aluminosilicates are materials having the general formula:

where M is a monovalent cation, preferably sodium. These materials contain some bound water and are required to have a calcium ion exchange capacity of at least 50 mg CaO/g. The preferred sodium aluminosilicates contain 1.5-3.5 SiO₂ units in the formula above. They can
5 be prepared readily by reaction between sodium silicate and sodium aluminate, as amply described in the literature.

Fabric Softening and/or Conditioner Compounds

- 10 The compositions of the invention may be in the form of a rinse composition, such as a fabric conditioner composition.

Therefore, also provided by the present invention are laundry rinse compositions comprising at least one amine- or amide-epichlorohydrin
15 resin, at least one anionic polymer and at least one textile compatible carrier. The laundry rinse compositions may contain an anionic surfactant which may be one or more of the anionic surfactants which may be used in the detergent active compositions described above. The rinse
20 compositions may contain both an anionic polymer and an anionic surfactant and contain an amount of anionic polymer and/or anionic surfactant which provides a total negative charge from its anionic groups that is not greater than the total positive charge provided by the cationic groups of the amine-epichlorohydrin resin and any cationic groups in the
25 anionic polymer. Suitable amounts of both the amine-epichlorohydrin resin and the total anionic polymer and/or anionic surfactant are in the range of from 0.01 to 35% by weight, (preferably 0.1% to 13.5% by weight, more preferably 3 to 7% by weight) so as to provide an amount of the components on the fabric of from 0.0005 to 5% by weight of the fabric, preferably 0.001 to 2% by weight of the fabric.

If the fabric care composition or the laundry rinse composition of the present invention is in the form of a fabric conditioner composition, the textile-compatible carrier will be a fabric softening and/or conditioning
5 compound (hereinafter referred to as "fabric softening compound"), which may be a cationic or nonionic compound.

The softening and/or conditioning compounds may be water insoluble quaternary ammonium compounds. The compounds may be present in
10 amounts of up to 8% by weight (based on the total amount of the composition) in which case the compositions are considered dilute, or at levels from 8% to about 50% by weight, in which case the compositions are considered concentrates.

15 Compositions suitable for delivery during the rinse cycle may also be delivered to the fabric in the tumble dryer if used in a suitable form. Thus, another product form is a composition (for example, a paste) suitable for coating onto, and delivery from, a substrate eg a flexible sheet or sponge or a suitable dispenser (such as a container having apertures
20 therein, for example) during a tumble dryer cycle.

Suitable cationic fabric softening compounds are substantially water-insoluble quaternary ammonium materials comprising a single alkyl or alkenyl long chain having an average chain length greater than or equal to
25 C_{20} or, more preferably, compounds comprising a polar head group and two alkyl or alkenyl chains having an average chain length greater than or equal to C_{14} . Preferably the fabric softening compounds have two long chain alkyl or alkenyl chains each having an average chain length greater than or equal to C_{16} . Most preferably at least 50% of the long chain alkyl

or alkenyl groups have a chain length of C_{13} or above. It is preferred if the long chain alkyl or alkenyl groups of the fabric softening compound are predominantly linear.

- 5 Quaternary ammonium compounds having two long-chain aliphatic groups, for example distearyldimethyl ammonium chloride and di (hardened tallow alkyl) dimethyl ammonium chloride, are widely used in commercially available rinse conditioner compositions. Other examples of these cationic compounds are to be found in "Surface-Active Agents and
10 Detergents", Volumes I and II, by Schwartz, Perry and Berch. Any of the conventional types of such compounds may be used in the compositions of the present invention.

The fabric softening compounds are preferably compounds that provide
15 excellent softening, and are characterised by a chain melting $L\beta$ to $L\alpha$ transition temperature greater than 25°C , preferably greater than 35°C , most preferably greater than 45°C . This $L\beta$ to $L\alpha$ transition can be measured by DSC as defined in "Handbook of Lipid Bilayers", D Marsh, CRC Press, Boca Raton, Florida, 1990 (pages 137 and 337). Substantially
20 water-insoluble fabric softening compounds are defined as fabric softening compounds having a solubility of less than 1×10^{-3} wt % in demineralised water at 20°C . Preferably the fabric softening compounds have a solubility of less than 1×10^{-4} wt %, more preferably less than 1×10^{-8} to 1×10^{-6} wt %.

25 Especially preferred are cationic fabric softening compounds that are water-insoluble quaternary ammonium materials having two C_{12-22} alkyl or alkenyl groups connected to the molecule via at least one ester link,

preferably two ester links. An especially preferred ester-linked quaternary ammonium material can be represented by the formula II:

- 5 wherein each R_1 group is independently selected from C_{1-4} alkyl or hydroxyalkyl groups or C_{2-4} alkenyl groups; each R_2 group is independently selected from C_{3-23} alkyl or alkenyl groups; and wherein $-R_3-$ is a linear or branched alkylene group of 1 to 5 carbon atoms, T is

10

and p is 0 or is an integer from 1 to 5.

Di (tallowoyloxyethyl) dimethyl ammonium chloride and/or its hardened tallow analogue is especially preferred of the compounds of formula (II).

15

A second preferred type of quaternary ammonium material can be represented by the formula (III):

wherein R_1 , p and R_2 are as defined above.

It is advantageous if the quaternary ammonium material is biologically
 5 biodegradable.

Preferred materials of this class such as 1,2-bis (hardened tallowoyloxy) -
 3-trimethylammonium propane chloride and their methods of preparation
 are, for example, described in US 4 137 180 (Lever Brothers Co).
 10 Preferably these materials comprise small amounts of the corresponding
 monoester as described in US 4 137 180, for example, 1-hardened
 tallowoyloxy-2-hydroxy-3-trimethylammonium propane chloride.

Other useful cationic softening agents are alkyl pyridinium salts and
 15 substituted imidazoline species. Also useful are primary, secondary and
 tertiary amines and the condensation products of fatty acids with
 alkylpolyamines.

The compositions may alternatively or additionally contain water-soluble
 20 cationic fabric softeners, as described in GB 2 039 556B (Unilever).

The compositions may comprise a cationic fabric softening compound and
 an oil, for example as disclosed in EP-A-0829531.

The compositions may alternatively or additionally contain nonionic fabric softening agents such as lanolin and derivatives thereof.

- 5 Lecithins are also suitable softening compounds.

Nonionic softeners include $L\beta$ phase forming sugar esters (as described in M Hato et al Langmuir 12, 1659, 1996, (1996)) and related materials such as glycerol monostearate or sorbitan esters. Often these materials are used
10 in conjunction with cationic materials to assist deposition (see, for example, GB 2 202 244). Silicones are used in a similar way as a co-softener with a cationic softener in rinse treatments (see, for example, GB 1 549 180).

- 15 The compositions may also suitably contain a nonionic stabilising agent. Suitable nonionic stabilising agents are linear C_8 to C_{22} alcohols alkoxylated with 10 to 20 moles of alkylene oxide, C_{10} to C_{20} alcohols, or mixtures thereof. Advantageously the nonionic stabilising agent is a linear C_8 to C_{22} alcohol alkoxylated with 10 to 20 moles of alkylene oxide.
20 Preferably, the level of nonionic stabiliser is within the range from 0.1 to 10% by weight, more preferably from 0.5 to 5% by weight, most preferably from 1 to 4% by weight. The mole ratio of the quaternary ammonium compound and/or other cationic softening agent to the nonionic stabilising agent is suitably within the range from 40:1 to about 1:1,
25 preferably within the range from 18:1 to about 3:1.

The composition can also contain fatty acids, for example C_8 to C_{24} alkyl or alkenyl monocarboxylic acids or polymers thereof. Preferably saturated fatty acids are used, in particular hardened tallow C_{16} to C_{18} fatty

acids. Preferably the fatty acid is non-saponified, more preferably the fatty acid is free, for example oleic acid, lauric acid or tallow fatty acid. The level of fatty acid material is preferably more than 0.1% by weight, more preferably more than 0.2% by weight. Concentrated compositions may comprise from 0.5 to 20% by weight of fatty acid, more preferably 1% to 10% by weight. The weight ratio of quaternary ammonium material or other cationic softening agent to fatty acid material is preferably from 10:1 to 1:10.

The fabric conditioning compositions may include silicones, such as predominantly linear polydialkylsiloxanes, eg polydimethylsiloxanes or aminosilicones containing amine-functionalised side chains; soil release polymers such as block copolymers of polyethylene oxide and terephthalate; amphoteric surfactants; smectite type inorganic clays; zwitterionic quaternary ammonium compounds; and nonionic surfactants. Preferably, the silicone component is a dimethylpolysiloxane with aminoalkyl groups.

The fabric conditioning compositions may also include an agent which produces a pearlescent appearance, eg an organic pearlising compound such as ethylene glycol distearate, or inorganic pearlising pigments such as microfine mica or titanium dioxide (TiO_2) coated mica.

The fabric conditioning compositions may be in the form of emulsions or emulsion precursors thereof.

Other optional ingredients include emulsifiers, electrolytes (for example, sodium chloride or calcium chloride) preferably in the range from 0.01 to

5% by weight, pH buffering agents, and perfumes (preferably from 0.1 to 5% by weight).

Further optional ingredients include non-aqueous solvents, perfume carriers, fluorescers, colourants, hydrotropes, antifoaming agents, antiredeposition agents, enzymes, optical brightening agents, opacifiers, anti-shrinking agents, anti-wrinkle agents, anti-spotting agents, dye transfer inhibitors, germicides, fungicides, anti-oxidants, UV absorbers (sunscreens), heavy metal sequestrants, chlorine scavengers, dye fixatives, anti-corrosion agents, drape imparting agents, antistatic agents and ironing aids. This list is not intended to be exhaustive.

Fabric Treatment Products

15 The composition of the invention may be in the form of a liquid, solid (eg powder or tablet), a gel or paste, spray, stick or a foam or mousse. Examples include a soaking product, a rinse treatment (eg conditioner or finisher) or a mainwash product. The composition may also be applied to a substrate (eg a flexible sheet) or used in a dispenser which can be used
20 in the wash cycle, rinse cycle or during the dryer cycle.

The fabric care compositions of the present invention have been found to possess the advantages of compositions containing cationic amine-epichlorohydrin resins, such as improved surface colour definition of the fabric following multiple washings and/or improved dimensional stability
25 of the fabric and/or reduced fabric fibrillation. Moreover, the compositions of the invention exhibit reduced dye transfer and/or improved stain release properties relative to those compositions.

The use of anionic polymers to improve the dye transfer properties of a fabric care composition and/or to improve the stain release properties of a fabric care composition is applicable to compositions containing amine-epichlorohydrin resins and/or other cationic polymers. Fabrics treated with the compositions of the invention can also exhibit beneficial properties due to the anionic polymer itself, such as antistatic properties, for example.

The fabrics which may be treated in the present invention may be in the form of garments and preferably comprise cellulosic fibres, preferably from 1% to 100% cellulosic fibres (more preferably 5% to 100% cellulosic fibres, most preferably 40% to 100% such as 75% to 100%). When the fabric contains less than 100% cellulosic fibres, the balance comprises other fibres or blends of fibres suitable for use in garments such as polyester or polyamide, for example. Preferably, the cellulosic fibres are of cotton or regenerated cellulose such as viscose.

The invention will now be described by way of example only and with reference to the following non-limiting examples.

EXAMPLES 1 TO 4

Fabric Preparation

All samples were prepared by repeating the following method five times:

730g of fabric (3 pieces undyed woven cotton sheeting, 1 piece of printed fabric for fabric care evaluation) was washed at 40°C on a cotton wash

cycle with 35g of Persil Original Non-Biological (trade mark) detergent. Samples were treated by rinse applying the required amount of product in the rinse cycle.

5 The products applied were:

Control - 0.1% Apomul SAK™ (polyamine-epichlorohydrin resin, as about 13% aqueous solution, Brookstone Chemicals)

Example 1 - 0.1% Apomul SAK™ + 0.1% Synthappret BAP™

10 Example 2 - 0.1% Apomul SAK™ + 0.15% Synthappret BAP™

Example 3 - 0.1% Apomul SAK™ + 0.1% Lambent CP-I™

Example 4 - 0.1% Apomul SAK™ + 0.1% Albucril LEV 50™

15 Synthappret BAP™ (Bayer), Lambent CP-I™ (Lambent) and Albucril LEV 50™ (BF Goodrich) are anionic polymers (Synthappret BAP™ is a polycarbamoyl sulphonate (a bisulphite adduct of a polyisocyanate), Lambent CP-I™ is a silicone carboxylate in acid form and Albucril LEV 50™ is a polyacrylate/styrene copolymer.

20 After the five applications, samples of each treatment were evaluated for dye transfer and stain release.

Dye transfer

25 30 cm square samples of the control and the product treated according to the invention were washed at 40°C on a cotton wash cycle in a Zanussi Jetsystem 1200 (trade mark) washing machine with 35g of Persil Original Non-Biological (trade mark) detergent together with Direct Red 80

standard cloths at a ratio of 6:1 treated : Direct Red 80 followed by tumble drying in a Miele Novotronic T430 (trade mark) tumble dryer on "extra dry" setting. The change in colour (ΔE) of the treated fabrics relative to untreated cloth subjected to the same dye transfer test was then measured using the Spectraflash (trade mark) spectrometer.

<u>Treatment</u>	<u>ΔE</u>
Control	8.12
Example 1	4.92
Example 2	4.49
Example 3	5.04
Example 4	4.56

Stain Release

Samples of the treated fabrics had 1 ml of red wine applied to the centre of the sample. After the wine had soaked in, the sample was left under ambient conditions for five days. The stained area was then measured using the Spectraflash (trade mark) spectrometer. The samples were then washed at 40°C with 35g of Persil Biological Powder (trade mark), tumble dried and the stains measured again.

<u>Treatment</u>	<u>ΔE of stain</u>	<u>ΔE after washing</u>	<u>$\Delta \Delta E$</u>
Control	25.36	11.82	13.54
Example 1	25.82	12.15	13.67
Example 2	25.39	10.28	15.11
Example 3	26.36	11.70	14.66

In this case the larger $\Delta\Delta E$ value, the more stain has been removed (ie the colour is paler).

5 Garment Care Benefits

The method used to determine the garment care benefit from the cationic polymers involved the determination of the effect of washing treatment on the colour and lightness of a printed fabric which is particularly susceptible to surface damage which appears as a change in the colour of the print.

The load used for the experiment consisted of three pieces of woven cotton sheeting 1m x 1.52m weighing approximately 700 g in total, and a piece of the printed fabric measuring 0.5m x 1m weighing approximately 30g, giving a total load weight of 730g. This allows the fabric freedom to move within the machine resulting in more damage.

The wash was carried out in a Zanussi Jetsystem 1200 (trade mark) washing machine at 40°C using 35g of Persil Original Non-Biological (trade mark) washing powder in the main wash. Treatments were applied in the rinse at a level to deliver 0.2% o.w.f of active ingredient.

After each cycle, the load was tumble dried in a Miele Novotronic T430 (trade mark) dryer using the extra-dry setting.

After five wash/dry cycles, the appearance was compared to an untreated sample and colour measurements were taken as necessary.

Where colour measurements were taken, the greater the change in colour (ΔE) or lightness (ΔL) indicates more severe damage which causes the colour to change more dramatically. The smaller the ΔE and ΔL values, the closer the fabric appearance is to the original, indicating a positive garment care benefit.

Colour measurements were carried out on areas of the printed fabric which had been dyed black and red. The results are as follows:

10 i. Black

Treatment	ΔL	ΔE
None	9.94	10.07
0.1 % Apomul SAK TM	4.15	4.25
0.2 % Apomul SAK TM	4.29	4.57
0.2 % Synthappret BAP TM	8.66	8.72
0.2 % Albucril LEV50 TM	7.83	8.04
Example 1	2.46	2.61
Example 2	2.77	2.82
Example 3	2.15	2.41
Example 4	3.43	3.53

ii. Red

Treatment	ΔL	ΔE
None	3.30	12.62
0.1 % Apomul SAK TM	0.91	6.11
0.2 % Apomul SAK TM	0.71	5.85
0.2 % Synthappret BAP TM	2.79	11.24
0.2 % Albucril LEV50 TM	2.26	9.89
Example 1	0.43	5.56
Example 2	0.66	5.04
Example 3	-0.01	3.82
Example 4	0.37	4.88

The results for the red and black areas of the printed fabric show that, in both cases, the colour care benefits of the cationic polymers are not only maintained but are surprisingly improved upon by the cationic/anionic polymer compositions of the invention.

5

EXAMPLES 5 TO 8

Rinse Adjunct Product Formulations

10 For a basic rinse-delivered garment care agent (ie with no softening agent), the formulations prepared were:

Example 5	Apomul SAK™	76.0%
	Synthappret BAP™	20.0%
	Synperonic A50™	1.0%
15	Softanol 50™	1.0%
	Water	2.0%

Example 6	Apomul SAK™	38.2%
	Synthappret BAP™	15.0%
20	Synperonic A50™	1.2%
	Softanol 50™	1.2%
	Water	44.4%

Example 7	Apomul SAK™	76.0%
25	Albucril LEV50™	20.0%
	Synperonic A50™	1.0%
	Softanol 50™	1.0%
	Water	2.0%

Example 8	Apomul SAK™	76.0%
	Lambent CP-I™	10.0%
	Synperonic A50™	1.0%
5	Softanol 50™	1.0%
	Water	12.0%

Synperonic A50 (trade mark) - C₁₃/C₁₅ primary alcohol ethoxylated with 50 moles ethylene oxide

10 Softanol 50 (trade mark) - C₁₂ secondary alcohol ethoxylated with 5 moles ethylene oxide

EXAMPLE 9

15 Fabric Conditioning Composition

A composition according to the invention was formulated as follows:

	Water	27.76%
20	Antifoam	0.03%
	Genapol C200™	0.75%
	HEQ	12.50%
	Preservative	0.06%
	Dye	0.15%
25	Perfume	0.15%
	Synperonic A50™	2.00%
	Apomul SAK™	50.00%
	Lambent CP-I™	6.60%

Genapol C200 (trade mark) - C₁₂ primary alcohol ethoxylated with 20 moles of ethylene oxide (ex Clariant).

- 5 HEQ=1,2-bis-[hardened tallowoxy]-3-trimethylammonium propane chloride (ex Hoeschst)
-

Claims:

1. Fabric care composition adapted for use in a laundering process comprising at least one cationic polymer which is an amine- or amide-epichlorohydrin resin or derivative thereof, at least one anionic polymer and at least one textile compatible carrier, wherein the cationic polymer and the anionic polymer are present in amounts such that the overall charge provided by the polymers is positive.
2. Composition as claimed in Claim 1, wherein the amine- or amide-epichlorohydrin resin is present in the composition in an amount of from 0.01 to 35% by weight.
3. Composition as claimed in Claim 1 or Claim 2, wherein the anionic polymer is present in the composition in an amount of from 0.01 to 35% by weight.
4. Composition as claimed in any one of Claims 1 to 3, wherein the amine- or amide-epichlorohydrin resin has one or more functional groups capable of forming azetidinium groups.
5. Composition as claimed in Claim 4, wherein the amine- or amide-epichlorohydrin resin has one or more azetidinium groups.
6. Composition as claimed in any one of Claims 1 to 3, wherein the amine- or amide-epichlorohydrin resin has one or more functional groups that contain epoxide groups or derivatives thereof.

7. Composition as claimed in any one of Claims 1 to 6, wherein the anionic polymer comprises carboxylate and/or sulphonate groups.

8. Composition as claimed in any one of Claims 1 to 7 which is a detergent composition further comprising at least one surfactant.

9. Composition as claimed in any one of Claims 1 to 7 which is a laundry rinse composition.

10. Composition as claimed in Claim 9 which comprises a fabric conditioning and/or softening compound.

11. Composition as claimed in Claim 9 or Claim 10 which further comprises a silicone component.

12. Composition as claimed in Claim 11, wherein the ratio of the amine- or amide-epichlorohydrin resin to the silicone component is from 1:1 to 30:1.

13. Composition is claimed in any one of Claims 1 to 12 which further comprises a perfume.

14. Use of an anionic polymer to improve the dye transfer properties of a fabric care composition which comprises a cationic polymer.

15. Use of an anionic polymer to improve the stain release properties of a fabric care composition which comprises a cationic polymer.

16. Use as claimed in Claim 14 or Claim 15, wherein the cationic polymer is an amine- or amide-epichlorohydrin resin or derivative thereof.

17. A method of treating fabric comprising applying to the fabric a
5 fabric care composition of any one of Claims 1 to 13 as part of a
laundrying process.

18. A method as claimed in Claim 17, wherein the composition is
applied to the fabric during the rinse cycle.

10

19. A method as claimed in Claim 17 or Claim 18, wherein the fabric
comprises cellulosic fibres.

20. A method as claimed in Claim 19, wherein the cellulosic fibres are
15 cotton or regenerated cellulose.

ABSTRACT

FABRIC CARE COMPOSITION

5 Fabric care compositions adapted for use in a laundering process such as
detergent compositions and laundry rinse compositions, comprise at least
one amine- or amide-epichlorohydrin resin or a derivative thereof, at least
one anionic polymer and at least one textile compatible carrier. The
compositions have improved dye transfer and stain release properties and
10 may be used in methods of treating fabric as part of a laundering process.
